

Abstract

The invention relates to a bevel gear transmission having a housing (1), whose walls (2) are provided with at least two passage holes (3, 3') for at least two bevel gears (4, 4') that engage with one another with their gearings inside the transmission housing (1). At least one of said bevel gears has a shaft (5) rotationally mounted in a bearing (22, 23) of a bearing casing (6), said shaft projecting from the transmission housing (1) through the passage hole (3), wherein the bearing casing (6) is fixed to the transmission housing (1). According to the invention, axial displacement of the bevel gear (4) can be exactly and reproducibly carried out due to the fact that a fixing part (9) that is configured separately from the bearing housing (6) is fixed to the transmission housing (1) said fixing part having an inner thread (13) that can be screwed with the outer thread of the bearing casing (6), that the relative angular position between the fixing part (9) and the bearing housing (6) can be fixed and that the bearing housing (6), when assembled with a cylindrical attachment (8), tightly fits into the corresponding passage hole (3) of the transmission housing (1), that is configured in the form of a guide.
